

HW 7 - Shiny

This activity gives you practice implementing some parts of creating a shiny app.

Our goal will be able to create the app you see here: https://shiny.stat.ncsu.edu/jbpost2/Shiny_HW/. This app requires the `shinyalert` package so please make sure you download that.

There is a starter `app.R` file, a `helpers.R` file, and a `my_sample_temp.rds` file to get you started.

You won't be able to run the `app.R` file as is. Open that file and I've left instructions in comments and quoted strings there. Try to get the app functional!

Start by creating a new folder to place these files in (likely in an R project and/or github repo but I'll leave that up to you). Then open the `app.R` file and read through it. Compare it to the app running on the website and try to update as you can.
